CattleKing PROTEIN MEAL PELLETS

When Second Best Isn't Good Enough

CattleKing Protein Meal Pellets are a wheat by-product of the grain ethanol distilling industry. They are essentially the same product as our CattleKing Protein Meal, in a pelletised form. With one major difference, the calcium/phosphorus ratios have been improved.

CattleKing Protein Meal Pellets contain 21% crude Protein, of which 80% is estimated to be rumen degradable (bypass). The unique combination of non-fibre carbohydrates provides a balanced source of energy for optimal rumen health and animal production.

CattleKing Protein Meal Pellets are highly palatable, making them a popular addition in many feed rations. This product is an excellent SAFE product for all classes of livestock.

Sub clinical acidosis from grain reduces fibre digestion and weight gain. Acidosis can lead to problems with feet, affecting the ability to graze. Inconsistent intakes of grain on pasture can compound acidosis problems. CattleKing Protein Meal Pellets contains very little starch (15%) therefore, it does not cause acidosis.

For best performance limit the intake of CattleKing Protein Meal Pellets to less than 1% of the body weight of the stock being fed (1kg per 100kg live weight), to a maximum of 6kgs a day. To limit intake, use self-feeders, feed out required amount at least 2-3 times a week. If you're looking for a product to mix with our Quicklick Topline, our CattleKing Protein Meal is more suited. Quicklick Topline should be made available to ensure adequate supply of minerals, non-protein nitrogen and Bovatec.
